

MACHINE LEARNING PROJECT

AI-Driven Tomato Leaf Disease Classification Using Self-Supervised CAE- CNN Framework

Muhammad Ali Tahir

Supervisor: Mr. Talha Nadeem

Superior University, Lahore | January 30, 2026

1. Introduction

The Problem: Plant diseases cause 20-40% annual crop losses globally, threatening food security

The Gap: Most deep learning models rely on ImageNet pre-training, not optimized for agricultural imagery

The Challenge: Manual diagnosis is time-consuming, requires expert pathologists, and prone to human error

Our Solution: Self-supervised CAE pre-training with two-phase CNN classification achieving 98.02% accuracy

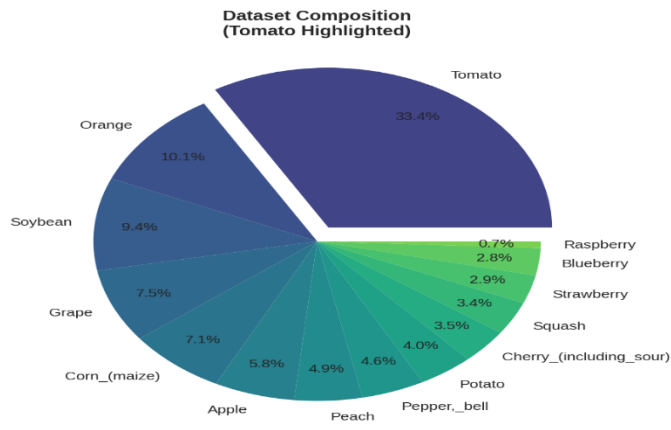

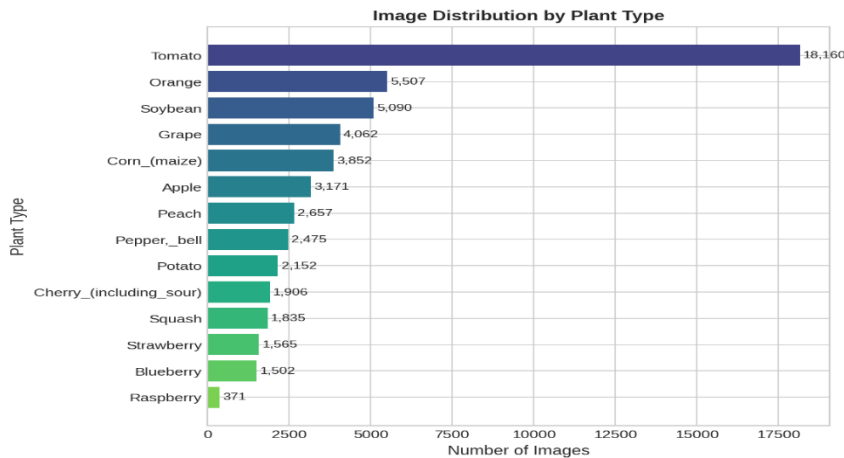

Figure 1: Dataset Composition

2. Project Objectives

Primary Objectives

- 1 Develop CAE-CNN achieving accuracy > 95%
- 2 Train without ImageNet pre-trained weights
- 3 Handle class imbalance (14.36x ratio)
- 4 Create interpretable feature representations

Technical Objectives

- 1 Achieve F1-Score > 0.95 across all classes
- 2 Implement two-phase training strategy
- 3 Validate with comprehensive metrics
- 4 Enable edge device deployment

3. Alignment with UN Sustainable Development Goals

SDG 2: Zero Hunger

- Reduces crop losses (15-25%)
- Supports sustainable agriculture
- Enables early disease intervention

SDG 9: Industry, Innovation & Infrastructure

- Applies cutting-edge deep learning
- Builds AI infrastructure
- Promotes innovation

SDG 12: Responsible Production

- Reduces pesticide use (20-30%)
- Optimizes resource allocation
- Supports precision farming

Project Impact

- Cost reduction: \$200-500/hectar
- 98.02% accuracy for automated screening
- Lightweight model (16.9M params) for mobile deployment

4. Dataset: PlantVillage Tomato Subset

18,160

Total Images

10

Disease Classes

14.36x

Class Imbalance

128x128

Image Resolution

Data Split: Train 80% (14,528) | Val 10% (1,816) | Test 10% (1,816) - Stratified sampling

Tomato Disease Classes - Image Distribution
(10 classes, 18,160 total images)

6. Methodology: Project Workflow

CAE+CNN - Plant Village Dataset: Complete Project Workflow

PHASE 1: Data Preparation

PHASE 2: Self-Supervised Learning (CAE)

PHASE 3: Supervised Classification (CNN)

PHASE 4: Evaluation & Deployment

Figure 4: Project Workflow

7. Data Pipeline

Data Pipeline: From Raw Data to Model-Ready Splits

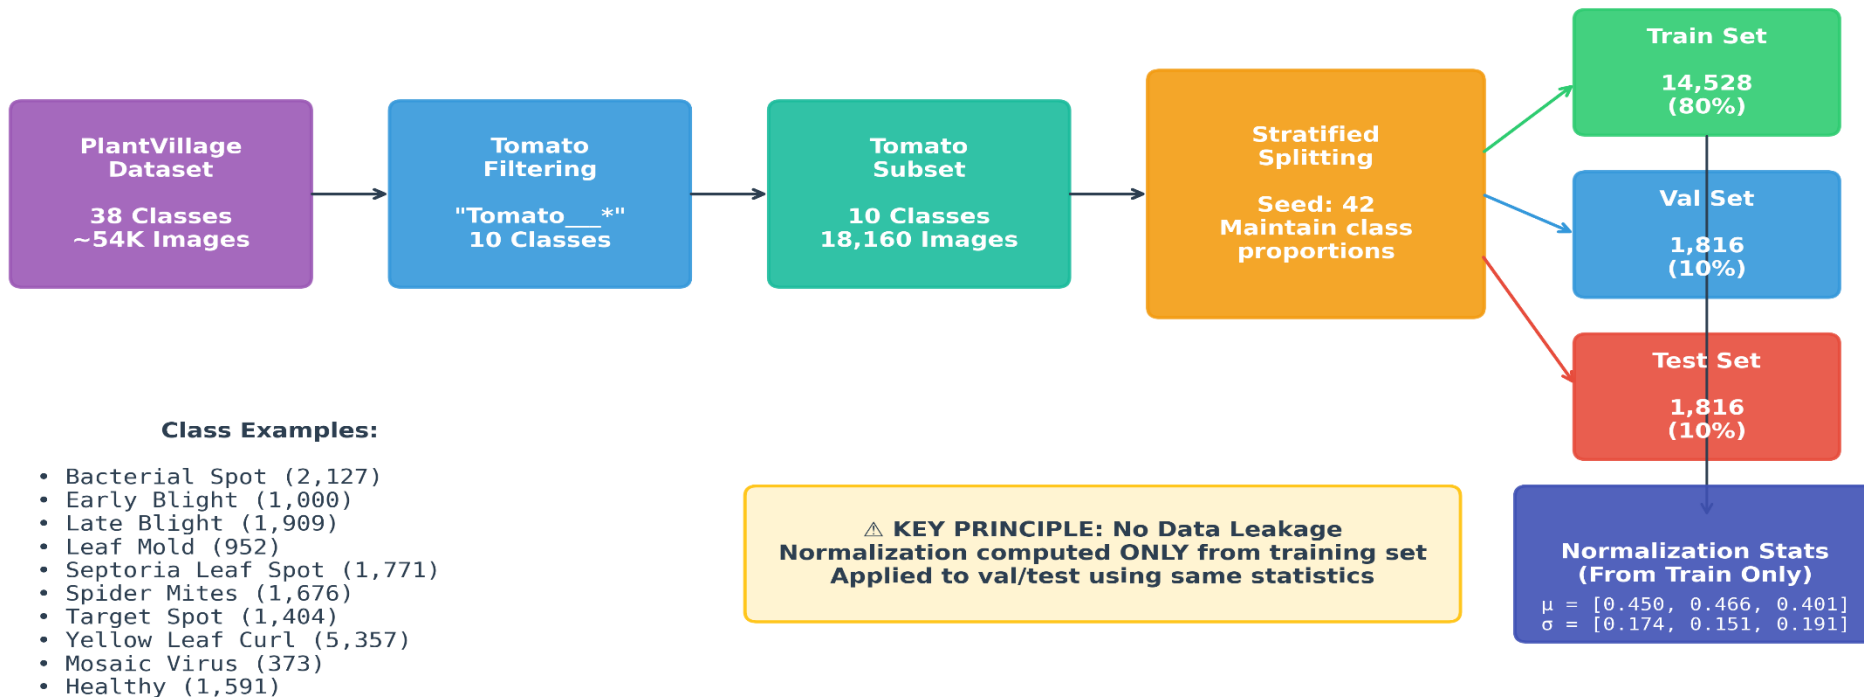

Figure 5: Data Pipeline

8. CAE Architecture: Self-Supervised Feature Learning

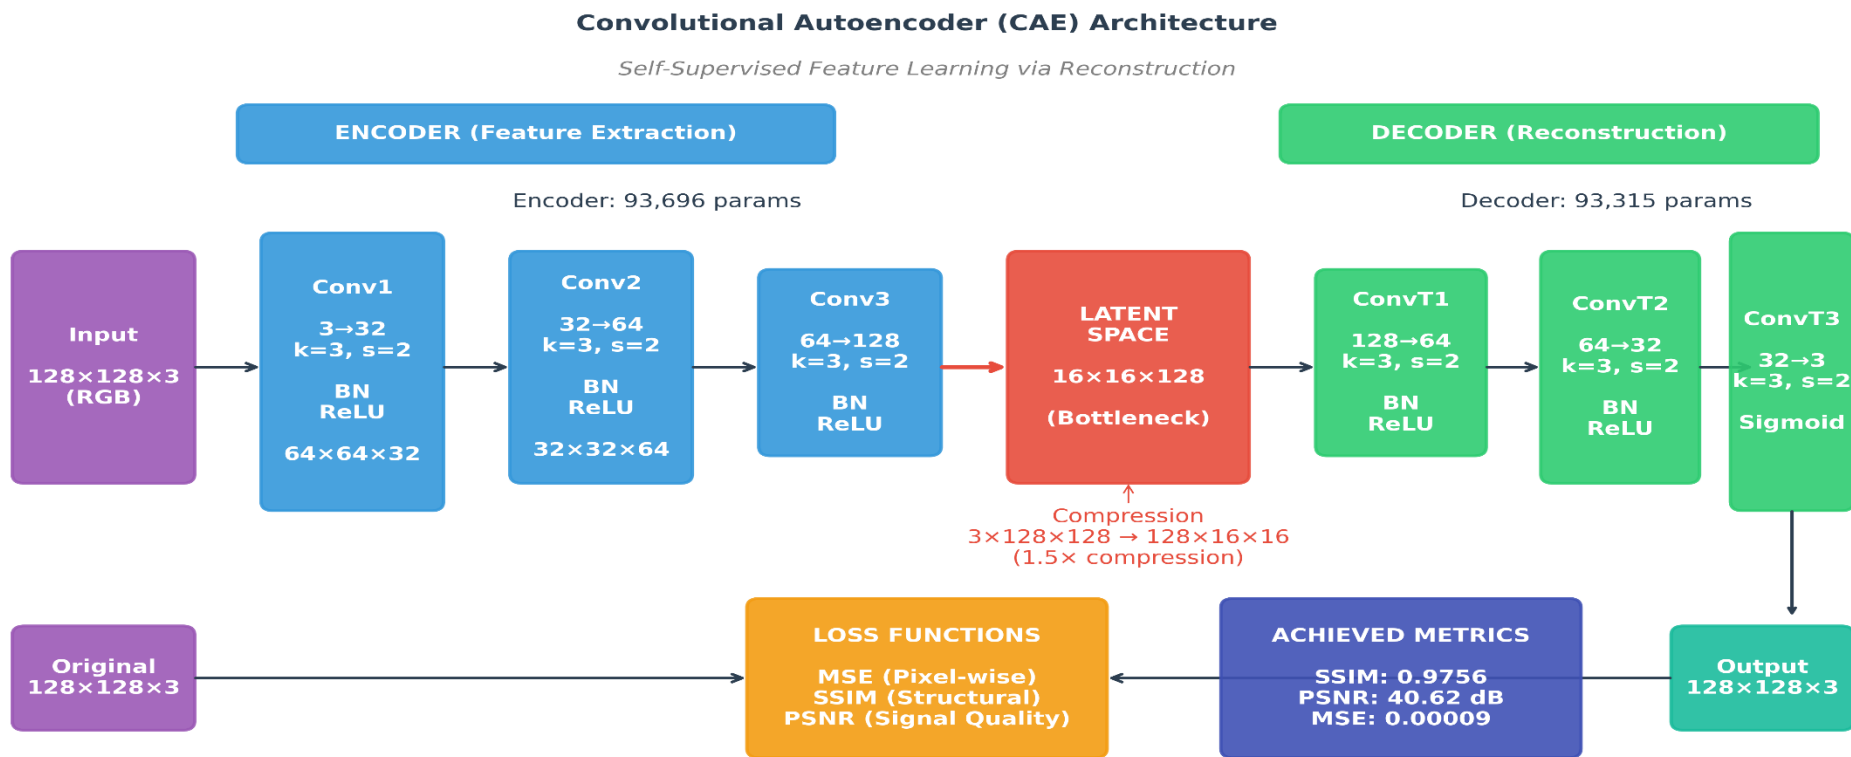

Figure 6: CAE Architecture

9. Two-Phase Training Architecture

Phase 1: Frozen Encoder

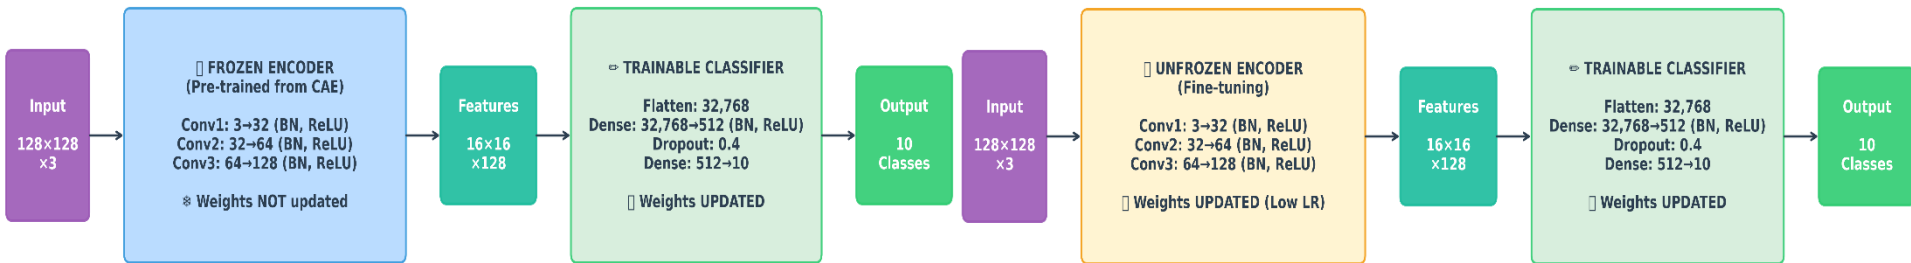

- CAE encoder frozen
- Classifier head trained
- LR: $1e-3$, Epochs: 15
- F1: 0.7711

Phase 2: Fine-tuning

- All layers unfrozen
- End-to-end training
- LR: $1e-4$, Epochs: 25
- F1: 0.9774 (+26.7%)

PHASE 1: Frozen Encoder (Train Classifier Head Only)

PHASE 2: Fine-tuning (End-to-End Training)

Phase 1 Stats: LR= $1e-3$ | 15 epochs | Trainable params: 16.7M | Best F1: 0.7711

Phase 2 Stats: LR= $1e-4$ | 25 epochs | Trainable params: 16.9M | Best F1: 0.9774

Figure 16: Sample Prediction

19. Key Results Summary

98.02%

Accuracy

0.9998

ROC-AUC

0.9787

Precision

0.9740

Recall

0.9762

F1 Score

26.7%

F1 - Improvement

Key Insights:

- Self-supervised CAE matches ImageNet transfer learning
- Two-phase training yields optimal adaptation
- All 10 classes achieve $F1 > 0.95$
- Lightweight (16.9M params) for edge deployment

20. Comparison with State-of-the-Art

Method	Year	Pre-training	Accuracy	F1
CNN-Stacking (Abbas)	2024	ImageNet	98.27%	0.985
T-Net (Batool)	2024	ImageNet	98.97%	-
ResNet50+MobileNet	2025	ImageNet	99.65%	-
ViT-Base	2025	ImageNet	99.17%	-
Proposed CAE-CNN	2026	Self-supervised	98.02%	0.976

Key Advantage: ONLY method achieving competitive performance (98.02%) WITHOUT ImageNet pre-training

21. Conclusion

Achievements

- ✓ Near-perfect discrimination (ROC-AUC 0.9998)
- ✓ 98.02% accuracy without ImageNet
- ✓ Domain-specific self-supervised learning
- ✓ Lightweight model (16.9M params)

Future Work

- Mobile deployment for field use
- Multi-crop disease detection
- Real-field image validation
- Severity estimation

"Self-supervised learning on domain-specific agricultural data achieves competitive performance with ImageNet transfer learning - demonstrating specialized pre-training may be more effective than generic features for plant disease detection."
